# VISUAL INTEGRITY

- **Proportionality**

- ◆ Representation as physical quantities should be proportional to the represented numbers

- **Utility**

- ◆ Graphical element should convey useful information

- **Clarity**

- ◆ Labeling should counter graphical distortion and ambiguity

- The magnitude of visual attributes should represent faithfully the magnitude of measures
- They should allow
  - ◆ Discrimination: are they different?
  - ◆ Comparison: which is larger?
  - ◆ Magnitude Assessment: how much larger?

$$LF = \frac{\text{size of effect shown in graphic}}{\text{size of effect in data}}$$

- Overstating
  - ◆  $LF > 1 \Leftrightarrow \text{Log}(LF) > 0$
- Understating
  - ◆  $LF < 1 \Leftrightarrow \text{Log}(LF) < 0$
- Fair
  - $LF = 1 \Leftrightarrow \text{Log}(LF) = 0$

$$LF = \frac{\text{size of effect shown in graphic}}{\text{size of effect in data}}$$

# Lie Factor

---

$$LF = \frac{\text{size of effect shown in graphic}}{\text{size of effect in data}}$$

# Lie Factor

$$\frac{18.7}{2.2} = 8.5 \text{ on graphic}$$

$$\frac{27.5}{18} = 1.52 \text{ in data}$$

$$LF = 8.5 / 1.52 = 5.59$$

# Example

## Debito pubblico (% PIL)

(\*) previsioni Commissione UE

Governo Conte

Governi Renzi e Gentiloni

# Example – Lie Factor

Debito pubblico (% PIL)

(\*) previsioni Commissione UE

$$LF = \frac{9 / 3.5}{135.2 / 131.4} = \frac{2.57}{1.03} = 2.5$$

# Example – Lie Factor

Debito pubblico (% PIL)

(\*) previsioni Commissione UE

$$LF = \frac{9 / 3.5}{135.2 / 131.4} = \frac{2.57}{1.03} = 2.5$$

# Example – Redesign

## Debito Pubblico (% PIL)

# Example – Redesign

## Debito Pubblico (% PIL)

# Guidelines for design

---

- Keep the physical Lie Factor = 1
- Limit the perceptual Lie Factor as much as possible

- Every element should convey useful information
- Unnecessary visual objects or attributes distract from the message
  - ◆ Different attributes trigger a search for a rationale (e.g. random colors)

$$\text{Data-ink ratio} = \frac{\text{data ink}}{\text{total ink used to print the graphic}}$$

- Proportion of a graphic's ink devoted to the non-redundant display of data information

◆ Or:

$$1 - \frac{\text{ink that can be erased without loss of information}}{\text{total ink used to print the graphic}}$$

Tufte's proposed redesign

- Maximize data–ink ratio
  - ◆ Erase non–data–ink
  - ◆ Erase redundant data–ink
  
- “Within reason”

*Above all else show the data*  
*E. Tufte*

- Include differences corresponding to actual differences
- Effective when one item is different in a context of other items that are the same
  - ◆ Bright saturated color among mid colors

- The presence of unnecessary elements that distract or hide the message conveyed by the diagram

# Chartjunk

## AMERICANS WHO HAVE TRIED WEED

Source: Gallup

SUNDAYS  
10<sup>P</sup>  
ET/PT

#highprofits

- Visual encoding and layout should make perception tasks easy and effortless
- Textual and support elements should provide effective support to understanding the information
- Any variation in the graph should represent useful information otherwise it is noise obfuscating the message

- **Textual** elements should provide effective support to understanding
  - ◆ Hierarchical
    - Size and position reflects importance
  - ◆ Readable
    - Large enough
  - ◆ Horizontal
  - ◆ Close to data (avoid legends)
- Always label the axes

- Get it right in black and white
- Use medium hues or pastels
  - ◆ Bright colors distract and tire out
- Use color only when needed to serve a particular communication goal

# Cognitive Dissonance

---

RED

BLUE

GREEN

YELLOW

Efficiency and efficacy of perception tasks is affected by:

- **Detection**

The capability to visually identify the objects that represent the data to be compared

- **Separation**

The distance between the objects to be compared

- affects negatively the accuracy

# Clarity

# Example

Trends in employment rates of 25-34 with a tertiary degree

# Analysis

---

- Proportionality
  - ◆ Due to non-zero base bars, it has a large lie factor (2.2):
    - ratio of real values: 87.8 : 61.9
    - ratio on graph: 37.8 : 11.9
- Utility
  - ◆ Most elements appear useful
  - ◆ X-axis ticks can be removed
  - ◆ Y grid could be made less prominent

# Analysis

---

- Clarity

- ◆ It uses a **dual scale** that confuses and makes very hard a visual comparison of the values and further distorting the compared values.
- ◆ The dual scale is not mentioned anywhere and it is not clear which values refer to which scale.
- ◆ In general the usage of bars is not the most appropriate visual representation if the goal is to show a trend or evolution in time.

# Redesign

Trends in employment rates of 25–34 with a tertiary degree

# Case study

## WHICH NFL TEAM IS YOUR FAVORITE?

SOURCE: PUBLIC  
POLICY POLLING

WXII  
12

# Assessment

---

- Question:
  - ◆ Is there one (or more) question addressed by the visualization?
- Data:
  - ◆ Is the data quality appropriate?
- Visual Integrity:
  - ◆ Are the visual features appropriate?

# Visual Integrity

---

- **Proportionality:**
  - ◆ Are the values encoded in a uniformly proportional way?
- **Utility:**
  - ◆ All the elements in the graph convey useful information?
- **Clarity:**
  - ◆ Are the data in the graph identifiable and understandable (properly described)?

# Question

---

- What are the most popular/favorite NFL teams in our audience?
- ...

# Data

WXII-TV is an NBC-affiliated television station serving North Carolina: home of Panthers

Team	Preferences
Panthers	34%
Cowboys	7%
Packers	7%
Patriots	6%
Steelers	6%
Redskins	5%
Broncos	4%
Total:	69%

# Full data

---

Team	Preferences
Panthers	34%
Cowboys	7%
Packers	7%
Patriots	6%
Steelers	6%
Redskins	5%
Broncos	4%
<i>Other</i>	31%
Total:	100%

# Integrity – Proportionality

34% corresponds to 50% of the pie!

$$\begin{aligned} 177 / 36.5 &= 4.8 \\ 34 / 7 &= 4.8 \end{aligned}$$

# Utility

WHICH NFL TEAM IS YOUR FAVORITE?

- PANTHERS
- COWBOYS
- PACKERS
- PATRIOTS
- STEELERS
- REDSKINS
- BRONCOS

Knowledge

Decisions

**Information Understanding**

Visual Patterns, Trends, Exceptions

**Quantitative Reasoning**

Quantitative Relationship & Comparison

**Visual Perception**

Visual Properties & Objects

Data

Representation/Encoding

# Visual Perception

---

- Any variable (measure) must be **visually encoded**, i.e. we need to identify:
  - ◆ Visual object to represent entity
  - ◆ Visual attribute to represent the measure

# Example

---

Votes received by four candidates in recent elections

Candidate	Votes	Proportion
Sergio	1 97800	50.09%
Alberto	1 40545	35.59%
Giorgio	53748	13.61%
Valter	2759	0.70%

<http://www.comune.torino.it/elezioni/2019/regionali/presidente/citta/>

# Encoding

---

- Visual object: line
- Visual attribute: length

Alberto

- Giorgio  
Valter

Sergio

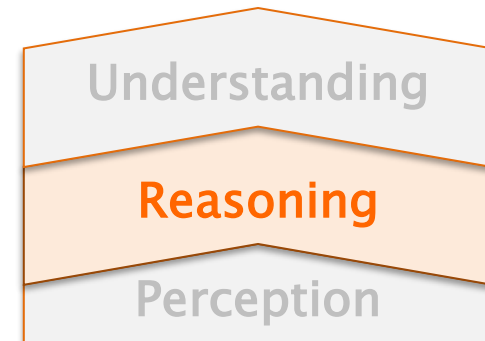

---

# Visual Reasoning

---

Layout and visual attributes allow:

- **Discrimination**
  - ◆ Distinguish visual objects or group of –
- **Comparison**
  - ◆ Place visual objects in order
- **Magnitude assessment**
  - ◆ Evaluate the (relative) magnitude of visual objects

# Reasoning

---

Alberto

# VISUAL PERCEPTION

# Data Visualization

---

## Understanding

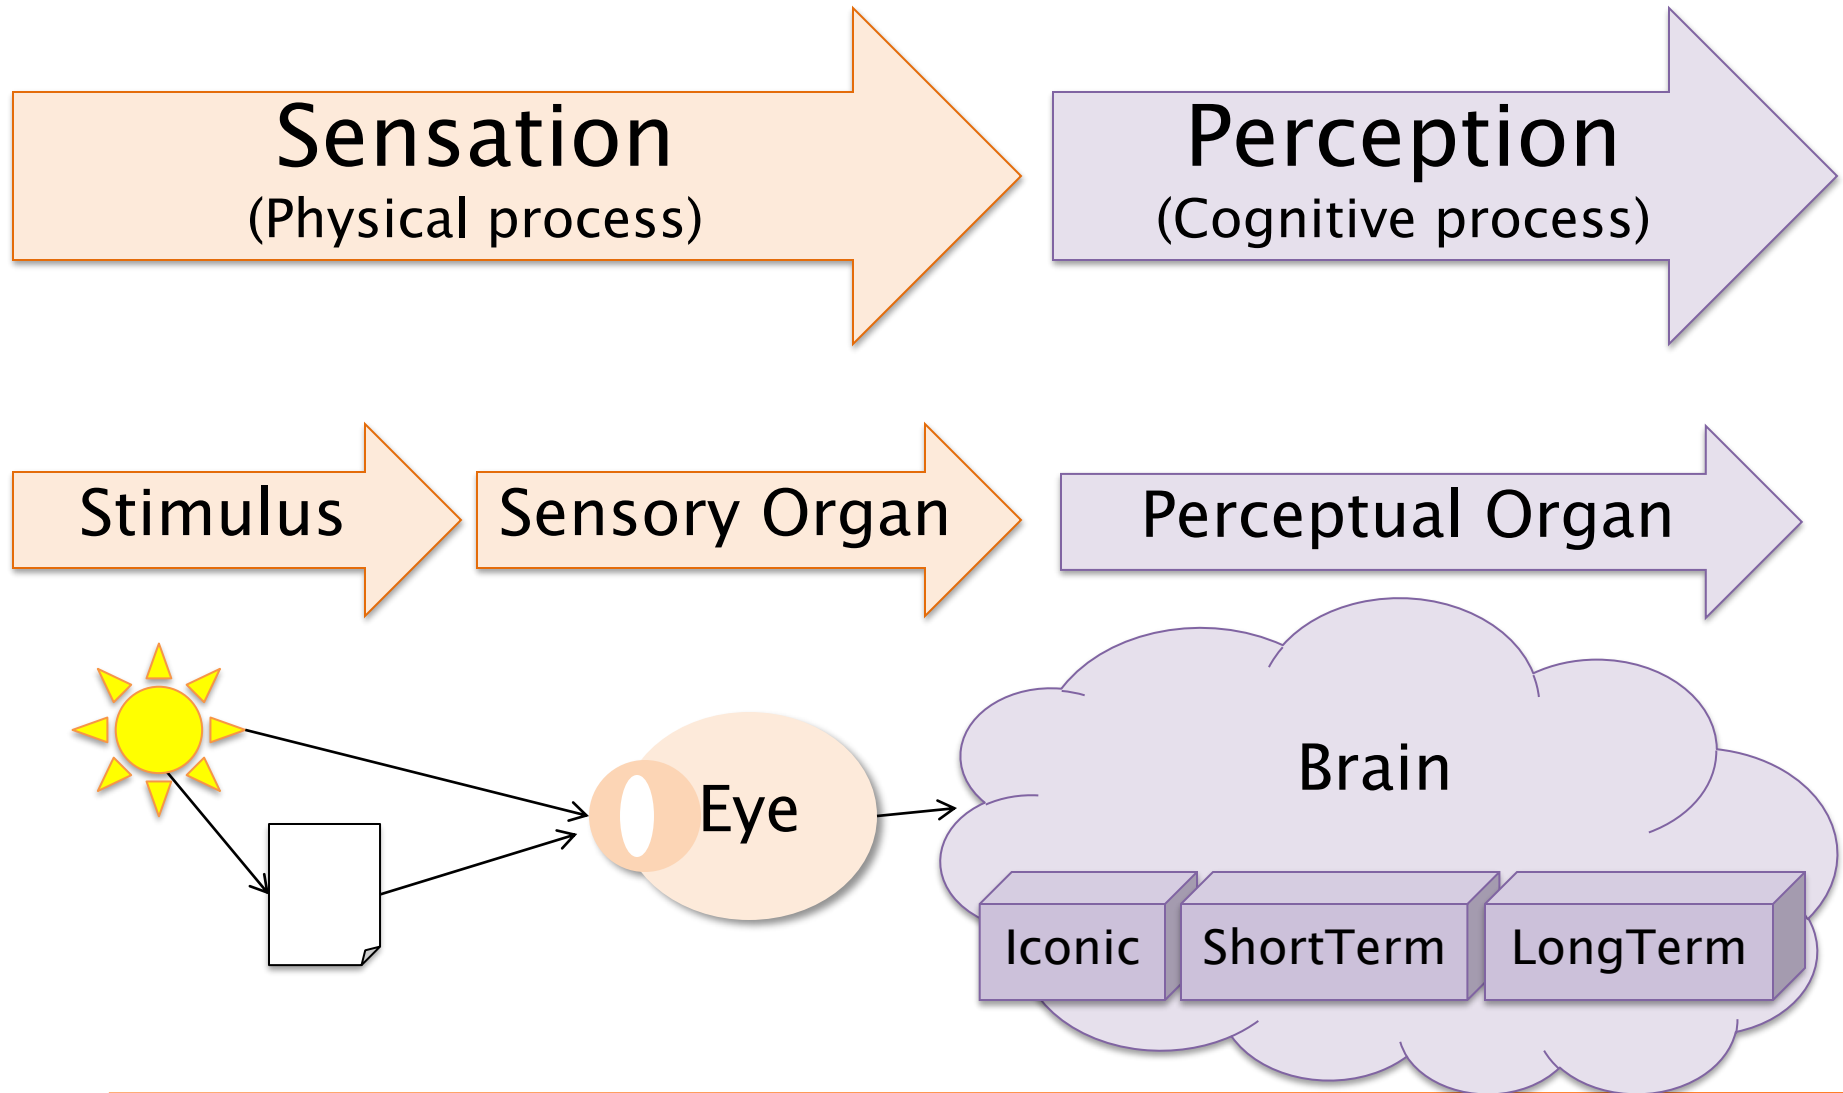

Data

Representation/Encoding

# Visual perception

# Memory Hierarchy

---

- Iconic memory (visual sensory register)
  - ◆ Pre-attentive processing
  - ◆ Detects a **limited number of attributes**
- Short-term memory (working memory)
  - ◆ Store visual chunks
  - ◆ Limited number
- Long-term memory
  - ◆ Store high-level knowledge

# Simplified Model

---

- The three levels of memory represent a simplified model
  - ◆ does not correspond to “real” physical brain structure
- Useful to explain a few phenomena
  - ◆ The  $7 \pm 2$  rule
  - ◆ Change blindness

# Change blindness

# Change blindness

# Pre-Attentive Attributes

4	9	5	6	7	2	2	2	8	3	1	1	0	1	8	6	2	6	2	1	4

# Encoding

---

- Encoding is the key to enable visual perception
  - ◆ Visual object to represent entity
  - ◆ Visual attribute to represent the measure
- Two main types
  - ◆ Quantitative (different properties)
  - ◆ Categorical (ordinal or not)

# Pre-Attentive attributes

Category	Attribute
Form	Orientation Length/distance Line width Size Shape Curvature Added marks Enclosure
Color	Hue Intensity
Spatial position	2-D position
Motion	Flicker Direction Speed

# Perception task

---

Visual attributes allow:

- Discrimination
  - ◆ Distinguish visual objects
- Comparison
  - ◆ Place visual objects in order
- Magnitude assessment
  - ◆ Evaluate the (relative) magnitude of visual objects

# Just noticeable difference

---

- Given a physical dimension (length, brightness, etc.)  $x$
- $d$  is the **just noticeable difference** if:
  - ◆ difference between  $x$  and  $x+d$  is perceivable
  - ◆ but not smaller differences
- $d$  depends on many factors:
  - ◆ Subject
  - ◆ Environment
  - ◆ Physical dimension

# Weber's law

---

- Just noticeable difference  $d$  is:

$$d_p(x) = k_p \cdot x$$

- Where
  - ♦  $x$ : dimension
  - ♦  $d_p(x)$ : just noticeable difference
  - ♦  $k_p$ : constant
    - Subjective
    - Environmental

# Consequences of Weber's law

---

- It is easier to compare lengths that differ by a large percentage
- The same difference is easier to notice between smaller measures
  - ◆ More likely to be larger than just noticeable difference

$$x < y \implies d_p(x) < d_p(y)$$

- Length of non-aligned objects is harder to compare
  - ◆ Double comparison

# Non-aligned objects lengths

---

# Non-aligned objects lengths

---

- Additional references my help comparison
  - ◆ They provide alternative possible comparisons
- If lengths range between 0 and a maximum (  $L$  ), e.g. percentages
- Comparing  $l_1$  and  $l_2$  (close to  $L$ ) that differ by a small amount  $d$ 
  - ◆ Difference  $L-l_1$  vs.  $L-l_2$  easier to notice than  $l_1$  vs.  $l_2$

# Stevens's law

---

- Perceive scale (magnitude ratio)

$$p(x) = c \cdot x^{\beta}$$

- Where  $\beta$  depends on spatial dimension
  - ♦ 1D: Length  $\rightarrow \beta$  in  $[0.9, 1.1]$
  - ♦ 2D: Area  $\rightarrow \beta$  in  $[0.6, 0.9]$
  - ♦ 3D: Volume  $\rightarrow \beta$  in  $[0.5, 0.8]$

Stevens S. S. (1975). Psychophysics, John Wiley & Sons.

# Stevens's law

# Stevens's law

---

# Consequences

---

- Prefer comparing lengths
- Avoid comparison between areas
  - ◆ Except for ordinal measures
- Never–ever make volume comparisons

# Attributes of form

---

Orientation

Shape

Line Length

Curvature

Line Width

Added mark

Size

Enclosure

# Orientation (angle or slope)

---

a)

b)

c)

d)

# Angle vs. Slope

- Slope of A–B is  $b/a$ 
  - ♦  $\tan(\alpha)$
- Slope judgment typically falls back to an angle judgment
  - ♦ Given an error  $\epsilon$  in the angle judgment
  - ♦ It is reflected in a slope error

$$\tan(\alpha + \epsilon) - \tan(\alpha) = \epsilon \cdot \tan'(\alpha) = \frac{\epsilon}{\cos^2(\alpha)}$$

– Getting infinite as  $\alpha$  approaches to  $\pi/2$

# Shape

---

- There is no common quantitative semantics for the shapes
  - Unless they are characters...
  - ◆ Fill textures are shapes too

# Length

---

# Effect of context

---

# Curvature

---

- There is no common magnitude assessment for the curvature

# Width

---

- Order can be identified
  - ◆ Difficult to appreciate actual magnitude

# Mark

---

- No common quantitative semantics of marks
- Number of marks could encode a natural number
  - ♦ Harder to read than a cipher

# Size / Area

---

# Enclosure

---

- No common quantitative semantics for enclosure
  - ◆ Except counting items enclosed

# Spatial Position

- Position along axis
  - ◆ Common scale
  - ◆ Distinct identical scales
    - Possibly un-aligned

- Distance

# Position

---

- A common scale

# Position

---

- Identical non-aligned scales

# Distance

---

- Points
  - ◆ Use length of imaginary connecting lines
- Lines
  - ◆ Distance orthogonal to tangent
    - Not what is meant in xy plots

# Detection and Separation

---

Comparison is affected by:

- Detection

- ◆ The capability to visually identify the objects that represent the data to be compared

- Separation

- ◆ The distance between the objects to be compared
  - affects negatively the accuracy

# Attributes of color

---

- Hue

- Saturation

- Intensity

- ◆ Luminance

- ◆ Value

# Hue

---

- There is no common ordering semantics for hues
  - ◆ High spatial frequencies are perceived through intensity changes
  - ◆ Often perceived as separated into bands of almost constant hue, with sharp transitions between hues
- Nominal values can be represented by suitably spaced values

# Intensity

---

- ♦ a.k.a. Luminance, Value
- Provides a perceptually unambiguous ordering
  - ♦ Context can affect accuracy

# Saturation

---

- Perceptually difficult to associate an ordered semantics
  - ◆ Can be combined with hue to increase discrimination

# Effect of Context

---

# Effect of Context

---

- Use uniform background
  - ◆ To make distinct visual objects for the same feature look the same
- Use a background color that is contrasting enough with the visual objects' color
  - ◆ To make visual objects easily seen
- Avoid non-uniform background

# Color usage

---

- Ordinal measure should be mapped to increasing saturation **and** intensity
  - ♦ Avoid rainbow palette
- Use sequential or diverging palette
  - ♦ E.g.

– <http://colorbrewer2.org/>

# Color Blindness

---

- Inability to see colors or perceive color differences

<http://www.color-blindness.com>

# Visual Encoding: Quantitative

---

Object	Attribute
Point	Position (w.r.t. axis/axes)
Line	Length Position (w.r.t. axis/axes) Slope
Bar	Length
Shape	Size (area) Count

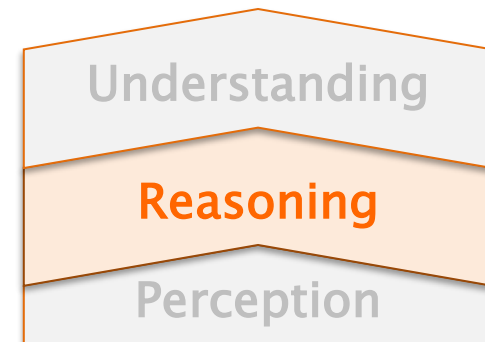

# Visual Encoding: Categorical

---

---

# VISUAL REASONING

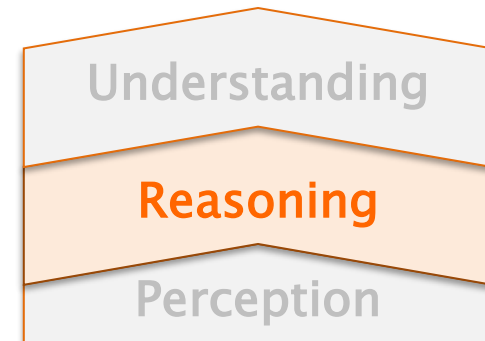

# Graph layout

---

Layout and visual attributes allow:

- **Discrimination**
  - ◆ Distinguish visual objects or group of –
- **Comparison**
  - ◆ Place visual objects in order
- **Magnitude assessment**
  - ◆ Evaluate the (relative) magnitude of visual objects

# Gestalt principles

---

## 2003 Sales

Direct Indirect

# Continuity replaces axis

---

# Distinct perceptions

---

- The immediacy of any pre-attentive cue declines as the variety of alternative patterns increases
  - ◆ Even if all the distracting patterns are individually distinct from the target
  - ◆ For each single attribute no more than **four** distinct levels are discernible

# Rainbow Pies

# Attribute Interference

---

# Attribute Interference

# Cultural conventions

---

- Reading proceed from left to right and from top to bottom
  - ◆ At least in western culture
- What is at the top (on the left) precedes what is at the bottom (on the right) in terms of
  - ◆ Importance
  - ◆ Ordering
  - ◆ Time

# Emphasis

Attribute	Tables	Graphs
Line width	Boldface text	Thicker lines
Size	Bigger tables Larger fonts	Bigger graphs Wider bars Bigger symbols
Color intensity	Darker or brighter colors	
2-D position	Positioned at the top Positioned at the left Positioned in the center
